Abstract

A short note written in Typeward. The whole loop, editing, compiling, and preview, happens on this machine; this page is the compiled output of main.tex.

1 Introduction

Typesetting is a solved problem; waiting for it is not. A local compiler admits no queue, so the round trip from keystroke to page collapses to the time your own hardware needs. Consider the identity

$$a^2 + b^2 = c^2 \tag{1}$$

set from a single line of source, hyphenated and justified in the same pass.

2 Method

Write in the source pane on the left; save with Ctrl+S and the compiled page on the right catches up.

3 Results

The compile finished in under a second, and the preview swapped the new pages in without a flash.

4 Discussion

Plain files in a plain folder: this project compiles the same way from the command line.
